## ALUMINUM STRUCTURAL PLATE HEADWALLS <br> BASIS OF DESIGN

## Required Backfill and Load Cases:

Backfill in the strucutral zone shall be AASHTO No. 57 stone ( $\phi=40^{\circ}$ ).

The above cases as directed by SCDOT for the development of the tables. However, these cases could easily develop into a constant slope from the top of the wall over time. Therefore the following case will be used to calculate the loads on the wall, and the above cases will be used to calculate the depth of bury and rod lenghts for the deadmen anchors.

AASHTO LRFD Bridge Design Specifications 3.11.5.3 - Active Lateral Earth Pressure Coefficient, $\mathbf{k}_{\mathrm{a}}$

$$
\mathbf{k}_{\mathrm{a}}=\frac{\sin ^{2}\left(\theta+\phi_{\mathrm{f}}^{\prime}\right)}{\Gamma\left[\sin ^{2} \theta \sin (\theta-\delta)\right]}=0.28 \quad \Gamma=\left\{1+\left[\frac{\sin \left(\phi_{\mathrm{f}}^{\prime}+\delta\right) \sin \left(\phi_{\mathrm{f}}^{\prime}-\beta\right)}{\sin (\theta-\delta) \sin (\theta+\beta)}\right]^{1 / 2}\right\}^{2}=2.242
$$

Where,
$\phi_{f}^{\prime}$, effective angle of internal friciton $\beta$, angle of fill to the horizontal
$\theta$, angle of back face to horizontal
$\delta$, friction angle between fill and wall
deg rad
$40.0 \quad 0.698$
$26.6 \quad 0.464$
$90.0 \quad 1.571$
$22.0 \quad 0.384$
(Table 3.11.5.3-1)
Compare ${ }^{1}$ Coulomb Theory results for $\mathrm{k}_{\mathrm{a}}$ and $\mathrm{k}_{\mathrm{p}}$ :

$$
\begin{aligned}
& \mathrm{k}_{\mathrm{a}}=\frac{\cos ^{2} \phi}{\cos \delta\left\{1+\left[\frac{\sin (\phi+\delta) \sin (\phi-\beta)}{\cos \delta \cos \beta}\right]^{1 / 2}\right\}^{2}}=0.28 \quad \delta \text { taken as positive for the active case } \\
& \mathrm{k}_{\mathrm{p}}=\frac{\cos ^{2} \phi}{\cos \delta\left\{1-\left[\frac{\sin (\phi+\delta) \sin (\phi+\beta)}{\cos \delta \cos \beta}\right]^{1 / 2}\right\}^{2}}=3.67 \quad \delta \text { taken as negative for the passive case }
\end{aligned}
$$

[^0]
## AASHTO LRFD PASSIVE LATERAL EARTH PRESSURE COEFFICIENT ANALYSIS

Figure 3.11.5.4-2-Computational Procedures for Passive Earth Pressures for Vertical Wall with Sloping Backfill (U.S. Department of the Navy, 1982a)

## AASHTO LRFD Bridge Design Specifications 3.11.5.4 - Passive Lateral Earth Pressure Coefficient, $\mathbf{k}_{\mathbf{p}}$

For non-cohesive soils, values of the coefficient of passive earth pressure may be taken from Figure 3.11.5.4-2 for the case of a vertical wall and sloping backfill.

Where,
$\phi_{\mathrm{f}}$, effective angle of internal friciton
$\beta$, angle of fill to the horizontal
$\delta$, friction angle between fill and wall

| deg | rad |  |  |
| :--- | :--- | :--- | :--- |
| 40.0 | 0.698 | $\beta / \phi_{\mathrm{f}}=$ | 0.66 |
| 26.6 | 0.464 | $-\delta / \phi_{\mathrm{f}}=$ | $-0.6 \quad \mathrm{R}=$ |
| 22.0 | 0.384 | $\mathrm{k}_{\mathrm{p}}=\mathrm{R}\left[\mathrm{k}_{\mathrm{p}}\left(\delta / \phi_{\mathrm{f}}=-1\right)\right]=$ | 0.682 |
|  |  |  | $(0.682)(58)=$ |

A value of 36.9 is too large a $k_{p}$ for deadmen application (note that the above chart is for vertical walls) in that it will not produce a conservative pullout resistance of the anchors (i.e. the lower the value the more conservative the result). Therefore, use the more traditional result from Coulomb's theory calculated on the previous page ( $k_{p}=3.67$ ).

## ROD LENGTHS AND DMA BURIAL DEPTHS

Rod lengths are determined by measuring from the wall to the effective zone (along the top row), adding an additional three feet, and then rounding up to the nearest whole foot. All rods will be the same length as the top row rods.

## DMA PULLOUT CAPACITY - BACKFILL/EMBEDMENT RESISTANCE

Anchor capacities will be based on the difference in passive and active soil pressures at the anchor elevation, and based solely on the area of the anchors (methods that account for the shear capacity of the soil above the anchor are more appropriate for a single anchor near the surface).

$$
\begin{aligned}
& \text { Dead Man Anchor (DMA) Pullout Force } \\
& \begin{array}{l}
\mathbf{P}_{\mathrm{p}}-\mathbf{P}_{\mathrm{a}}=\left(\mathbf{k}_{\mathrm{p}}-\mathrm{k}_{\mathrm{a}}\right) \gamma \mathrm{h}=3.39 \gamma \mathrm{~h} \\
\quad \gamma=125 \mathrm{pcf} \\
\mathbf{k}_{\mathrm{p}}=3.67 \\
\mathbf{k}_{\mathrm{a}}=0.28
\end{array}
\end{aligned}
$$

$\mathrm{T}_{\mathrm{u}}=$ Factored Pullout Resistance $=\phi\left(\mathbf{P}_{\mathrm{p}}-\mathbf{P}_{\mathrm{a}}\right)=\phi(3.39 \gamma \mathbf{h})$
$\phi=$ resistance factor for anchor pullout
$\phi=0.65$ for anchors in granular soils, Table 11.5.6-1

$$
\mathrm{T}_{\mathrm{u}}=2.2 \gamma \mathbf{h}
$$

$$
\begin{aligned}
& \boldsymbol{\ell}=1^{\prime}-8 " \text { " (top row), } 2^{\prime}-4 " \text { (intermediate and bottom rows) } \\
& \boldsymbol{\omega}=\text { width of DMA (into the page) }=22^{\prime}-4 " \\
& \text { A }= \text { Area of DMA }=\boldsymbol{\ell} \times \boldsymbol{\omega} \quad \text { (planar area) } \\
& \mathbf{T}_{\mathbf{u}}(\mathbf{l b s})=\left(\frac{\mathbf{P}_{\text {top }}+\mathbf{P}_{\text {bot }}}{2}\right) \mathbf{A}
\end{aligned}
$$

See "Rod Lengths and DMA Burial Depths" sheet for dimensions $H, h_{1}, h_{2}$ and $h_{3}$.

## Live Load Surcharge, LS

The increase in horizontal pressure $\left(\Delta_{\mathrm{p}}\right)$ due to live load surcharge may be estimated as $\mathrm{k}_{\mathrm{a}} \gamma_{\mathrm{s}} \mathrm{h}_{\mathrm{eq}}(3.11 .6 .4-1)$.
$\Delta_{\mathfrak{p}}=$ constant horizontal earth pressure due to live load surcharge, LS
$\mathrm{k}_{\mathrm{a}}=0.28 \quad \gamma_{\mathrm{s}}=125 \mathrm{pcf}$
$h_{\text {eq }}=$ equivalent height of soil for vehicular load per Table 3.11.6.4-1

The load factor for both vertical and horizontal components of live load surcharge (LS) shall be 1.75 (Table 3.4.1-1).
Horizontal componenet of $L S=\Delta_{p}$

Use $h_{\text {eq }}$ values for LS located 1.0 ft or further from the backface of the wall.
$1.75 \Delta_{\mathrm{p}}=(1.75)(0.28)\left(125 \mathrm{lbs} / \mathrm{ft}^{3}\right)(2 \mathrm{ft})=122.5 \mathrm{lbs} / \mathrm{ft}^{2}$
Table 3.11.6.4-1 - Equivalent Height of Soil for Vehicular Loading on Retaining Walls Parallel to Traffic

| 8 | 122.5 | 542.5 |
| 10 | 122.5 | 647.5 |
| 12 | 122.5 | 752.5 |

## LOAD CASES

Four load cases shall demonstrate the various loadings that can occur during construction and over the service life of the completed structure:

Case 1 Backfill only between top and bottom anchors. This case produces the maximum moment in a two anchor wall and sometimes the maximum tension on the middle anchor on a three anchor wall

Case 2 Completley backfilled with no passive pressure at the toe. This case shall ensure stabiltiy in the event of total scour at the base of the wall.

Case 3 Backfill to the centerline of the top anchor with no passive pressure at the toe. This case shall represent the worst case construction loads.

Case 4 Completely backfilled with the toe secured with passive pressure. This case shall model the actual installation of the structure as designed.

$\mathrm{T}_{\mathrm{u}}=\phi \mathrm{F}_{\mathrm{y}} \mathrm{A}=(0.90) \mathrm{F}_{\mathrm{y}} \mathrm{A}=25.4 \mathrm{kips}$
$T_{u}=$ factored tensile resistance of the anchor tendon. For mild steel the resistance factor ( $\phi=0.90$ ) shall be applied to $\mathrm{F}_{\mathrm{y}}$ (Table 11.5.6-1)

## ANCHOR SPACING

There will be an increase in one or more of the end reactions due to the overhang of the wale beam at the end of the wall. The increase is minimal but a factor will be used to increase reactions accordingly. The increased reaction will be used to determine the anchor spacing across the entire level. The diagrams below model an infinitely long wale beam with deadmen anchors spaced a distance $\ell$ apart with a maximum overhangs of $\boldsymbol{\ell} / 4$ and $\ell / 2$.

Reaction coefficients for span $\ell$ and span overhang $\ell / 4$
Reaction $=($ Reaction coefficient $) \times \boldsymbol{\omega} \ell$

Reaction coefficients for span $\ell$ and span overhang $\ell / 2$
Reaction $=($ Reaction coefficient $) \mathrm{x} \boldsymbol{\omega l}$

The beam analysis for an overhang of $\boldsymbol{\ell} / 4$ shows a maximum reaction coefficient of 1.08 (second reaction from the end).

The analysis for the $\ell / 2$ overhang shows a maximum reaction coefficient of 1.05 .

Based on the beam analysis an end factor of $\mathbf{1 . 0 8}$ will be used as a multiplier to accommodate the worst case scenario, while the maximum overhang will be established as $\boldsymbol{\ell} / 2$.

## Corrugated (9" x 2½") Aluminum Structural Plate, ASP

$\mathrm{I}\left(\mathrm{in}^{4} / \mathrm{ft}\right)=\left(0.1249 \mathrm{in}^{4} / \mathrm{in}\right)(12 \mathrm{in} / \mathrm{ft})=1.4988 \approx 1.50 \mathrm{in}^{4} / \mathrm{ft}$
$\mathrm{c}=(2.50+0.150) / 2=1.325 \mathrm{in}$
$\mathrm{S}\left(\mathrm{in}^{3} / \mathrm{ft}\right)=\mathrm{I} / \mathrm{c}=1.131 \mathrm{in}^{3} / \mathrm{ft}$
$\mathrm{M}_{\mathrm{y}}(\mathrm{lb}-\mathrm{ft} / \mathrm{ft})=\mathrm{F}_{\mathrm{y}} \mathrm{S}=24,000(1.131)(1 / 12)=2,262 \mathrm{lb}-\mathrm{ft} / \mathrm{ft}$
$\mathrm{M}_{\mathrm{p}}=3.18 \mathrm{k}-\mathrm{ft} / \mathrm{ft}$ (published) $\quad\left(\mathrm{M}_{\mathrm{p}}=3,180 \mathrm{lb}-\mathrm{ft} / \mathrm{ft}\right)$
Flexural capacity of vertical elements $\phi \mathrm{M}_{\mathrm{p}}=0.9 \mathrm{M}_{\mathrm{p}}$ (Table 11.5.6-1)
$\phi \mathrm{M}_{\mathrm{p}}=\mathbf{0 . 9 0 ( 3 , 1 8 0 )}=\mathbf{2 , 8 6 2 ~ l b - f t / f t}$

## Aluminum Structural Plate Headwall - General Notes:

1. Aluminum structural plate headwalls shall conform to the latest requirements of AASHTO M219 or ASTM B746 with a minimum thickness of 0.150 ".
2. Headwalls may incorporate the full variety of shapes and sizes available in corrugated metal pipe and structural plate culverts (arch pipe, arch, box culvert, et al). Additionally, headwalls may be equipped with wingwalls of the same design and material. However, it shall be incumbent upon the project engineer to ensure constructability and structural adequacy through the implementation of submittal requirements (shop drawings, calculations, etc).
3. It shall be the responsibility of the installation crew to implement sound installation practices consistent with AASHTO LRFD Bridge Construction Practices. As necessary and at the discretion of the project engineer, the headwall manufacturer or other expertise may be enacted to supervise construction when a bid item for such activity has been included in the contract documents or project specifications.
4. A culvert stub shall be integral with the headwall by means of a full periphery weld on both the interior and exterior of their junction. The headwall is properly placed at the design elevation by ensuring the stub is placed at grade for the culvert crossing.
5. Backfill placement and compaction shall be consistent with Section 26 of the AASHTO LRFD Bridge Construction Specifications. All backfill in the structural zone shall be \#57 washed stone or other as approved by the engineer of record.
6. The headwall shall be properly shored through the backfilling process. In general, the wall should be braced at the wale line located above the fill line until the corresponding anchor is completely embedded. The wall shall also be braced at the top anchor location until completely backfilled.
7. All steel components (nuts, bolts, tie back rods) shall have a hot-dipped galvanized coating.
8. As a matter of expedience and to the extent practical, the headwall-culvert system may be completely or partially assembled and lifted as a unit to facilitate placement of the unit in a prepared excavation complete with bedding to grade.
